

**Vice Ministerio de Paz  
Observatorio de la Violencia**

**Atlas Cartográfico de  
Ocurrencia de Delitos  
en Costa Rica.**

**0IJ-2021**

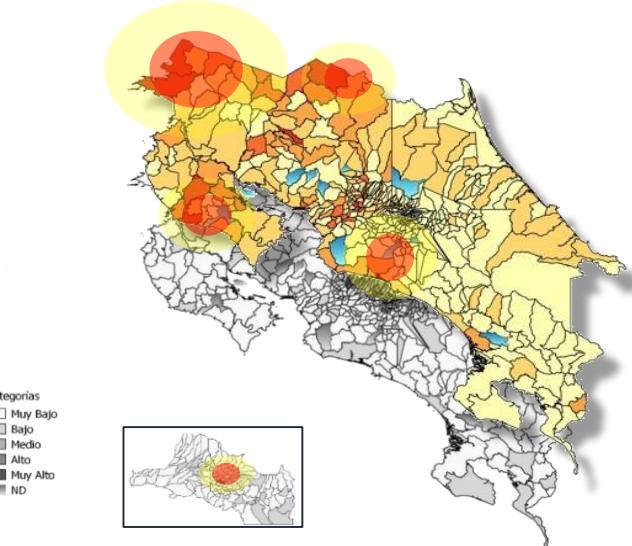

El Observatorio de la Violencia del Vice Ministerio de Paz, presenta el **Décimo Atlas Cartográfico de Delitos correspondiente al año 2021**.

En esta ocasión el Atlas se divide en dos partes:

**1- Mapas de Conglomerados:** Para la elaboración de los siguientes mapas se realizó un análisis de conglomerados utilizando las tasas de incidencia a nivel distrital por cada 10.000 habitantes.

Estas tasas se calcularon utilizando los datos de delitos del Organismo de Investigación Judicial, y las proyecciones de población del Instituto Nacional de Estadística y Censos de Costa Rica para el año 2021.

**2- Mapas de Puntos Agregados:** También se construyeron mapas de puntos agregados según la incidencia de los delitos en el territorio.

## FUENTES DE INFORMACIÓN

### I. Análisis Criminal del Organismo de Investigación Judicial:

- Homicidio doloso.
- Asalto (víctima: edificación, persona, vehículo, vivienda y otros).
- Hurto (víctima: edificación, persona, vehículo, vivienda y otros).
- Robo (víctima: edificación, persona, vehículo, vivienda y otros).
- Robo de vehículo.
- Violación, estupro y abuso deshonesto.

### II. Instituto Nacional de Estadística y Censos de Costa Rica:

- Población total proyectada al 30 de junio según provincia, cantón y distrito.

## ANÁLISIS DE CONGLOMERADOS

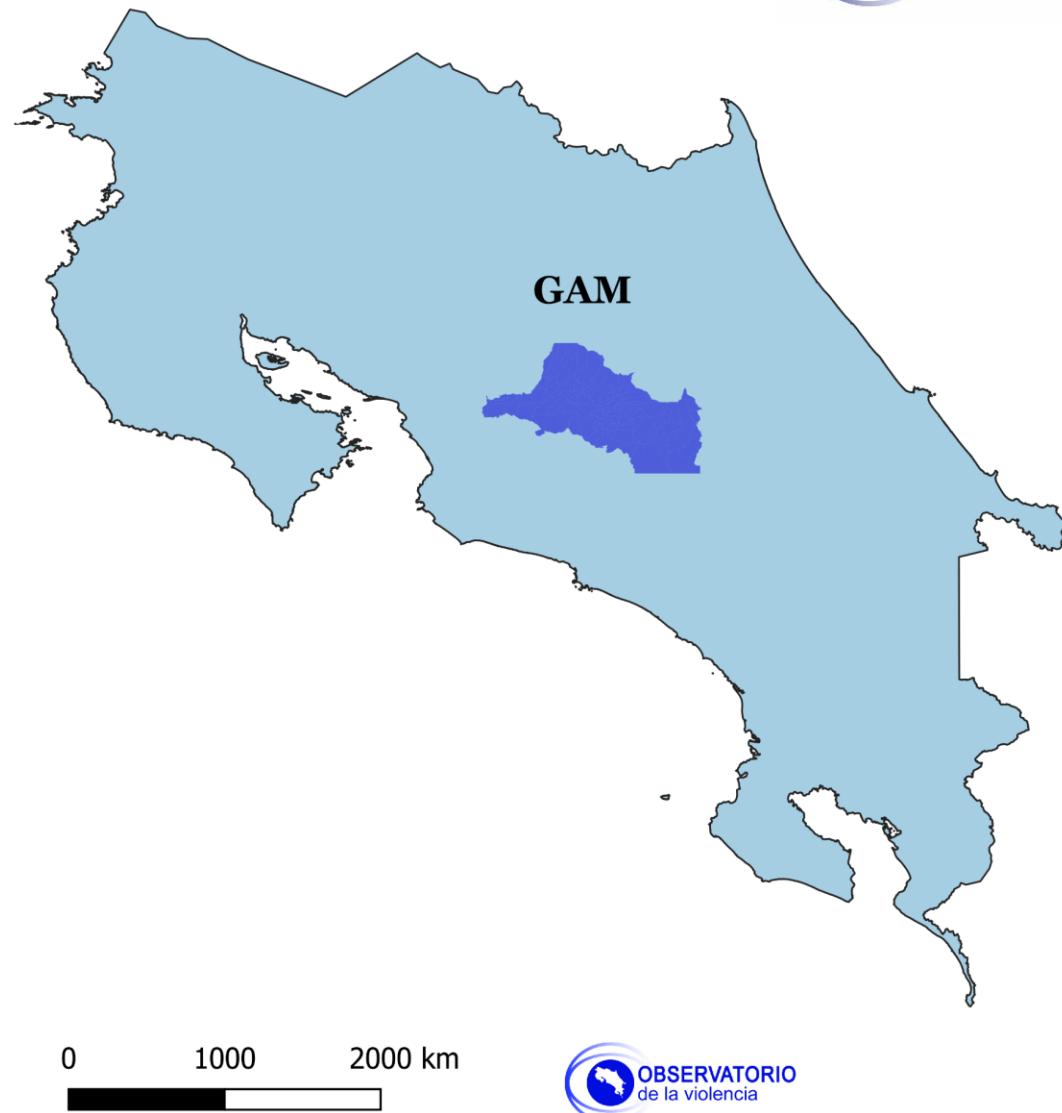

El análisis de conglomerados es una técnica de análisis de datos multivariable, su objetivo es agrupar casos (distritos) de manera que los pertenecientes a un mismo grupo sean lo más parecidos entre sí, es decir, que el grupo esté cohesionado internamente. Los pertenecientes a grupos diferentes deben de tener un comportamiento distinto con respecto a las variables analizadas esto es, que cada grupo debe de estar aislado externamente de los demás grupos. En resumen se busca que la variancia estadística dentro del grupo sea mínima y entre los grupos máxima.

El análisis de conglomerados que se utiliza es un procedimiento de  $k$  medias donde se empieza utilizando los valores de los primeros  $k$  casos como estimaciones de los  $k$  medias de los conglomerados, donde  $k$  es el número de conglomerados especificado por el usuario. Los centroides de los conglomerados iniciales se construyen asignando cada caso al conglomerado con el centroide más cercano y entonces actualiza el centroide.

Un proceso iterativo encuentra los centroides finales y a cada paso los casos son agrupados en el conglomerado con el centroide más cercano y los centroides son recalculados. El proceso continua hasta que no ocurran cambios en los centroides o hasta que un número máximo de iteraciones sea alcanzado. Este procedimiento es útil cuando el usuario posee variables cuantitativas y desea utilizar la técnica de manera exploratoria repitiendo el análisis con distinto número de conglomerados y comparando las soluciones obtenidas hasta encontrar el valor de  $k$  idóneo.

La Gran Área Metropolitana (GAM) es la principal aglomeración urbana de Costa Rica, que incluye las conurbaciones de las cuatro ciudades más grandes del país (San José, Alajuela, Cartago y Heredia) todas localizadas en la Meseta Central. Cuenta con aproximadamente 3 millones de habitantes (cerca del 60% de la población costarricense) y una superficie de 2.044 km<sup>2</sup> (poco más de 4% del área nacional). Es la región más urbanizada, poblada y económicamente activa de la nación; foco para la concentración de servicios, infraestructura y sedes gubernamentales.
